

## **Mirror Installation Instructions**

Each mirror is shipped with two metal posts/plates. Each post/plate is installed on the wall using the appropriate anchors/screws for the wall material. The posts/plates need to be installed the proper distance apart as it relates to the brackets\* on the mirror frame itself.

*\*Note: It is important that the screws used to install the brackets have a small enough surface to recess into the pre-drilled holes in these posts/plates so the mirror frame can easily slide onto them.*

After the two metal posts/plates are installed the proper distance apart, the mirror frame needs to slide onto these two metal posts into the receiver brackets attached to the back of the mirror frame.

The glass is then slid into the channel between the receiver brackets and the frame.
